Jms multisites for joomla version 1.3.37 (all editioins)

  -   Fix a Joomla 3.3 compatibility that replaced the class JRegistry by a namespace Registry.
    In some case, the JRegistry may not yet be declared because JMS starts before Joomla and must be defined in JMS
  -   Fix Joomla 2.5+ compatibility when searching for the list of templates (style) available and when the "debug is ON" in the configuration.php of the slave.
    Ignore any MySQL error in case where the table #__template_style is not present

Improve the "maintenance" menu

  -   add a Show/Errors/Hide details for the websites that help be focused on the errors
  -   Improve diagnosis on shared tables (views) to propose an automatic rebuild of sharing
   - Detection of sharing modification
  -   Add the possibility to fix the extension in addition to the core Joomla
  -   Detect the case where extension PHP code is removed and extension still defined in the DB

Bundled with Patches definition 1.3.33

  -   Fix patch for Community Builder V2.0
  -   Remove the patch for new Joomla 3.3 password encryption on Joomla 2.5.17 or lower.
    (The version before Joomla 2.5.17 doesn't contain some functions required to implement the J3.3.x password encryption and that result by the impossibility to install the patch under J2.5.17).
  -   Add JMS Tools (install) definitions for :
   - Calc Builder
  -   Add Joomla 3.2 sharing definition for:
   - Widgetkit
  -   Add Joomla 3.3 sharing definition for:
   - Widgetkit
