Version 1.2.25 : Fix bug introduced in 1.2.23 that affect the Single Sign-In
Last Updated Friday, 19 March 2010 16:50

In Jms Multisites for joomla 1.2.23, we have introduced the generation of a new "secret" value when creating the slave site.

This has a side effect on the "Single Sign-In" that result by different session_id for each domain and therefore disabled the Single Sign-In.

In this version, we have removed the generation of the "secret" value to keep the same value than the master.

Therefore the JReviews extension that expect to have different secret values to have specific configuration now share the configuration.

If you have created slave site with Jms Multisite 1.2.23, you can update all the slave site configuration.php file manually to copy the value in the secret present in the master configuration.php file. The objective is to use the same secret value for all the slave sites.
