Add Joomla 1.7 compatibility

- Fix again some DB access after that joomla revamped all the DB APIs that is not compatible with the earlier joomla version.
   In particular this take in account the new J1.7 "connection" field that replace the J1.6 "_connection" and J.5 "_ressource" field.
- Also add the detection of wrong replace DB Prefix present in Joomla 1.7.0 that might result by a delete of all tables in a DB.

Improve the front-end website creation

- Add a new Error processing when a website can not be created from the front-end and it is required to login first.
   This may avoid "infinite loop" when the redirection comeback to the same page.
- Add the possibility to create an Alias directory into a directory that does not exists.
   ie. /home/account/domains/{site_prefix}/public_html

Bundled with Patch definition 1.2.65

- Add new patch for JoomlaCK Editor
- Add JMS Tools (install) definitions for :
 - Printme
