Updates in Jms multisite for joomla version 1.2.95

- Fix a bug in joomla 2.5 when refreshing a website to install new extensions.
  In some circonstances, the module or plugin may replace the definition of a component.
  The symptom is that the "component"/ extension name has the name that is modified or the rendering in the menu is incorrect.
  This may also result by a "com_xxxx load error".
- Fix the possibility to ignore the "manifest" version when using the parameter MULTISITES_IGNORE_MANIFEST_VERSION
  This feature is helpfull when it is required to upgrade an extension in the slave before the master or when an extension has a special installer with another name for an "install bootstrap".

- Add in the JMS Tool the possibility to install extension that does not use joomla table prefix (ie. joocart - oc_%)
- Bundled with Joomla 2.5.7 installation files

Bundled with Patches definition 1.2.89

- Add JMS Tools (install) definitions for :
  - JooCart (opencart)
  - RPL
- Add Joomla 2.5 sharing definition for:
  - AwoCoupon
  - iProperty
  - VMAffiliate
