white page when trying to access /Administrator
Posted by mcine - 2009/01/02 17:34

Hi there,
i'm using JMS 1.1, i can replicate the hole website with the database using a template and it's working for me. to create a slave website i use the same database as the master website but with a different prefix then i access the slave website via http://www.domaine.com/multisites/slave1 but when trying to access the administrator area i have just a white page !!!

did i do somthing wrong?
by the way, symbolic links are disabled.

thanks for your help.

SOLVED!

Thanks anyway! :)

When the Symbolic Link is not allowed, the key element is to setup cPanel (or similar admin tool) for the domain (or subdomain) to point on the directory of the master (document root).

Perhaps that your domain or subdomain was pointing to an inexisting directory that would result by a "white page".
