Installing JMS Multisite in slave sites

Posted by PhilippeStefano - 2012/06/16 11:18

Is it possible to have JMS Multisite automatically pre-installed on slave sites so that each of them can also create their own slaves.
Objective is to give affiliated sites the opportunity to create their own slave sites.

In other words, is it possible to create the following scheme:

I-Master
I--slave1(new master)
I-----slave1.1
I-----slave1.2
I--slave2(new master)
I-----slave2.1
I-----slave2.2
I- ...

Thanks for your kind reply.

Phil

Yes you can do that.
See for example www.mywebsite2win.com that is a portal that propose websites ready to use with default content and look.

If you want to create affiliate where the people does not really have accessed from the back-end and where just few fields are customized like "name, address, phone, logo, ...", it is also possible to create a specific plugin and a specific layout to allow your customers enter all the fields from the front-end and have the website automatically ready with the customized value.
