Multi Sites Search Problem

Posted by james@playerocity.com - 2013/02/12 14:58

Hello,

We have the following installations:
MultiSites Version 1.2.84
Joomla! 2.5.4 Stable

I just installed the Multi Sites Search, but can't get it to run. No errors, just when you try to search from the frontend it doesn't bring up results only goes to the page in which the form exists.

Have followed the directions to the best I could.

I have the following items in admin I am not sure what to enable and disable. I have tried disabling all Smart Search items but that didn't work. I have tried every combination I can think of.

MultiSites Version 1.2.84
Joomla! 2.5.4 Stable

Plugins:
Search - Multisites Content
Search - Multisites Categories
Smart Search - Newsfeeds
Smart Search - Content
Smart Search - Contacts
Smart Search - Categories

Modules:
Search - Smart Search Module
Search - Search Module

Components:
Search
SmartSearch

Any help would be most appreciated.

Thanks
James

Did you verified that the plugins are enabled and that you have setup the plugins to declare on which slave site you want that the search are performed.

The "Multisites Search Plugin" are working with the "joomla search" and NOT with the "Joomla smart search".

It works with the joomla search module or search component (not the smart search)
The "smart search" (also call finder in joomla) is a new functionality introduced in Joomla 2.5 and that does not exist in Joomla 1.5, 1.6, 1.7

I notice that you would like to have a "Multisites Smart Search plugins" that does not exists yet.
