Article Sharing questions

Posted by wooglenetwork - 2009/09/04 20:06

Hi,

After the success of MulitSites version 2 I have now got several website all running from one. That made is much easier when joomla not long realised an update. Thanks for making it easier as i have around 10 website and growing :P .

I today decided to buy the article sharing, i installed it and went to create a link to another website. After I checked the link on the website they all come up fine but when I click on the article to view it just show a blank page??

I dont know why this is and wondering if there is anything that I am doing wrong? I have read through the user manual, but can't find anything there.

I hope someon can help me.

But thanks for the component :)

When I have cliched on your link, I have received a page.
I don't know if this is the correct page but I received a page

Yes the page comes up that is the menu link created in back end.

I have no problem showing one article but the problem is that when you click one of the links in the page to show the full article it loads a plank blank and doesnt even say anything.

Have you already try without SEF to see if this is related to your SEF or not.
Otherwise, I don't see like that.

I suspect a PHP syntax error somewhere that may result to such "blank page" but I can not tell you more.
The only way would be to debug on your server and try identify the component, module, plugin that may cause this problem.
