Articles shared on the master frontpage from slave

Posted by twgcommunications - 2009/10/01 21:00

Hi,

I have the master site pulling articles from the slave sites, however once you click on the article to get a full article view it remains in the master site. How would I make it so that it goes to the respective slave site and opens the article in the full page view??

Thanks, Dion

If you want to redirect the user to the website where it was create then you can not use the "article sharing for JMS" but insert a link with a the full URL.
The problem is that most of the editor may replace the full URL by a relative path when the domain is identical to the domain that create the link. (ie. if you create a page on www.domain.com and that you put a link like http://www.domain.com/page.html will be replaced by "page.html" because www.domain.com is identical).

With JMS, if you create 2 differents domain (or sub-domain) that are synonym, you could create the page on a special "editor.domain.com" that will insert a link "www.domain.com/page.html" in this case as "editor.domain.com" and "www.domain.com" are different, that keep the full URL in the link (http://www.domain.com/page.html).

So the idea is to use 2 differents domain where one is used to create the page and insert the link on the other one. As they are synonym (the same site), this will allow create a full URL instead of a relative path.
