(solved) MyBlog (2)

Posted by chrissy6930 - 2009/10/17 10:16

---

hi there,

table #__myblog_user holds , amongst others, the customized blog title and blog description a user can edit in the myBlog dashboard

since these should be the same site wide shouldn't this table be shared then?

==========

If you have a look in the list of extension, you will see that MyBlog has NOT the possibiilty to be shared. So you can NOT share its content between websites.

Click on the JMS Tools help button to see the list of extensions that are defined in JMS and which one can be shared.
or see the list here
http://www.jms2win.com/component/content/article/135

---

oh yes I'm familar with that list.

thus what would be the solution if that table cannot be shared?

do you happen to have a suggestion?

NO suggestion.

The sharing of an extension require to see this extension in interactions without joomla core.
If extension require too many thing from the joomla table (because they are linked), I never include this extension as sharing candidate.

The only extension that can be share are the one that only require to share the joomla users.
As soon as an extension require to be linked with something else like the articles, categories, or whatever else, it is not included as shared extensions. This create too many interactions that require to share everything. This is not the objective to have the same content for all the websites.

This is the reason for example that we have created a speciific "article sharing for JMS" to provide such flexibility.

_____

okies!

so for the matter outline here I would also need the article sharing component then?

==========

Re:MyBlog (2)

_____

This is not because you will have the "articles sharing for JMS" that you will be able to share the MyBlog.

You requirement just mean that a new extension that we could call "Multisite MyBlog" should be developped to use the same kind of technology than the "Articles Sharing for JMS".
This extension does not exists.
