

## **backup?**

Posted by choubix - 2009/11/05 10:53

---

hello,

I am going to embark on the adventure and launch a joomla community that I intend to redirect to 2 other websites.

I am considering JMS.

It is very attractive as it would save a lot of time dealing with updates / maintenance.

nevertheless I am worried with the backup possibilities.

I have tried Joomlapack before on a single joomla website and it worked fine.

I have read bad comments on joomlapack + JMS.

is there any way to backup the whole thing (master + slaves + DB) without running into trouble? (I was thinking of a dump of the whole database in phpmyadmin -easy- but I have no clues on how to backup the website's files as I am certainly not going to download every single file 1 by 1 via ftp...)

thanks!

---

I have replied several times the procedure that I use personally for the backup / restore

For the DB, I use PHPMyAdmin (export / import) to Backup / restore the DB.  
It works correctly and also performs a correct backup of the view.

For the files, I use a unix command from a SSH terminal

tar -cvf this backup (C)reate (V)erbous (F)ilename  
tar -xvf this restore e(X)tract (V)erbous (F)ilename

This will create tar file that you can compress with gzip
