Multisite Issue

Posted by alwinaugustin - 2009/11/09 12:41

Hi,

I am a newbie in Multisite component. I am using it for my client website. I installed it successfully to the Joomla and is working. I have also installled all the patches. Now the problem is that when i create a site using the component,it can only be accessed via 'http://mydomain.com/multisites/subsite', where subsite is the one that I have created using the multisite component. I have to get it like 'http://mydomain.com/subsite'. But when I installed it in some local machines, thenI am getting it correctly. So I think this may because of some server issues. Could anyone help me ? Please consider it as an urgent .. Pleae help :(:(:(

First if you test JMS on a localhost, there is a special procedure described in the user manual that explain how to simulate a domain name.

If you want to create a slave site with http://mydomain.com/subsite, you just have to deploy the website in this directory and perhaps ask to create the directory.
In JMS, you can also ask to create the directory when not present.

For example
Site ID = slave1
domain = {site_url}/{site_id}
deploy directory = {root}/{site_id}
Create directory = ON (Enabled)

Becarefull that when you do that without a JMS templates, this will also create symbolic links in each new slave site with the exting directories.
Perhaps it would be better to create a JMS templates rules to specify which "Files and Folders" you want to create for the slave site.
