# Problems with slave site

Posted by ghanbarimajid55 - 2010/02/11 11:08

---

Hi every body

i am new in jms 2 win . . .

i install the component on a joomla and when i want to create slave site i have problem that the slave site forwarded to the joomla master site !!1

i download the heloo.php and upload it . so it apears that :In this case the Symbolic Link feature is not available.

My server is win Server 2008 with plesk and PHP 5 .

so what should i do ?

When working on Windows platform, the functionality concerning the Symbolic Link is not allowed.
This mean that all the website must be assigned to the same directory.

In addition, as you are workiing with plesk, it will be difficult for you to specify the directory of the master.
The only way that I see in this cas is to use "parked domain" to create synonyms of your master website domain. When you create a synonym (alias) of a domain, it is assign to the same directory than the "primary" domain.

In your case, the key element is to configure correctly plesk to be allow using different domain or subdomain having the same directory path.

You can not use domain redirection because this change the URL information required by JMS (that will be the redirected domain - here the master).
