Front End Admin Login

Posted by jrblaine - 2010/02/21 21:25

Hi,

We're using JMS with the Virtuemart Plugin, when a site is ordered and created, the admin user assigned is not being set with the new email address and password. Any idea what is going on?

You have to check in the JMS templates that you have selected the user for which the psw and email must be changed.

When it is not selected, JMS use the first user in the DB that has the "Super Administrator" permission. In general this is the "admin"

Yes the user was selected, we had created a user fe_admin, also when we created the slave site I made sure I was using the correct password I used during creation of the slave site, and I checked the config file to be sure that it was using the correct database and tables. However when I try to log in to the slave site with the admin selected in the template I get an error stating the user name and password do not match. When I check the database table for that slave site the user email and encryption pattern match the users in the master site's database table.

This is the only thing given me troubles, everything else seems to be working as expected and i'm just stumped.
