Domain problem - slave site

Posted by webbmary - 2010/02/22 11:47

My master site have one domain (e.g. www.master.net)

In my "Edit DNS Zone" I have add another domain (e.g. www.slave.net) with an A-record to the same server/IP as the master domain and I write the subdomain in JMS but it doesn't work. The only way I can install my slave site is to write the "Deployed directory":

/home/ACCOUNTNAME/domains/MASTER.NET/public_html/multisite/SLAVE1

and instead of using the slave domain I write the sub directory in the field: "List of domain names" (e.g. www.master.net/multisites/slave1)

What am I missing?? What do I do to get this work?

Ah, my colleague told me to put an alias/domain pointer. I've missed that.
