Is this project viable with JMS?

Posted by EliteIntegrity - 2010/03/23 13:16

Hi there,

If I give an overview of the project I want to achieve can I have some feedback, tips and a yes or no to if it is possible at all? Thanks.

I have multiple domains that I want different content and articles on.

I want all the domains to have an indetically configured Virtuemart with identical products and categories with all the order processing etc done from one site.

A kunea forum shared between all the sites as well.

All user accounts esp forum/virtuemart should be shared accross all domains.

I need to use a Rockettheme template and some of their cool add ons.

I will be starting from the beginning with all domains. What is the best process/order/configuration.

Is JMS for me? Will I need other JMS products etc?

Thanks for reading.

John. :S

You will need Jms Multisites + the "Article Sharing for JMS'.
It is possible to share the VM and Kunena.
Concerning VM, as you could read at many places in the forum, there are constraints concerning the sharing of some configuration like the Payment Method and the Shipment confgiuration that is common to all the website.

Concerning RoketThemes templates and modules, they have some of them that may not be compatible with JMS. Some other are OK and we have published some patches for some modules.
So check the list of extensions.
http://www.jms2win.com/component/content/article/135

The advice that I can give you is consider the master website like a repository, a library where you put all the extensions.
In general I recommend to not publish this website.
Use an architecture like the one presented in tutorial video 16
http://www.jms2win.com/tutorial#jms12x-16

Consider the "Slave 1" like your main website (not the master) - that can be a portal, ...
