Pre-Sales Question

Posted by shyampandit - 2010/05/19 12:58

Hi,

I am looking for the following configuration.. do tell me if its possible with JMS.

I have a site - city.domain.com and I want to make sites for other cities like city2.domain.com and share jomsocial data/users among them.

Each site would have its own separate directory using JReviews.. does JMS support this?

Also I use a rockettheme using gantry 2.0, is it compatibile with JMS?

Thanks!

Concerning the creation of city.domain.com and city2.domain.com, and share the users with JomSocial, YES this is possible.

Concerning JReviews, this is an IonCube encrypted application and we have reported issues that they not solved. So if you use JReviews, you will share the same configuration for all the website and will also have some problem.

Concerning Gantry, there are also issue concerning the templates parameters.
That were reported to Rocketthemes and they have declined to fix their framework implementation.
As our company is not in responsible for the support of these companies, we can just report you that it will not works as you could expect.
