SiteStatus
Posted by DaveC - 2010/06/18 15:43

Hello

It would be very helpful to have a list of available fields that are accessible for use with SiteStatus. I would like to set the status of a site using the owner_id

Would this be valid code?MultisitesUtils::updateStatus('owner_id', $owner_id, $newStatus);

Basically I would like to be able to change the status of all the sites of a given user.

Thank you in advance
Dave

Yes this will probably works.
As you have all the code of JMS, I can just suggest you to test it and read the source "utils.php" that use the "site.php" source concerning the definition of a site.
You will find all candidate key but becarefull that they are not always filled.

The only one that is guarantee is the "id" that correspond to the Site ID.

So experiment it.

Hello

I have figured it out. May I suggest a small change to this function?

I know it is bad to change JMS core files so I will probably copy this function into my plugin. If you remove the return true; on line 197 of utils.php the foreach will loop through ALL sites instead of stopping when it finds a match.

This will allow you to set the status on all sites of a given user using owner_id

Thank you very much for your reply. I did get this to work using owner_id but only on the first site that is created gets set to Confirmed. Strangely the the next sites that are built are set in pending.

see the following for the results http://screencast.com/t/NmEyMzAz

YES, I will do it and add an optional parameter in the API to allow "$apply2AllSites = false".

By default the parameter will be false to work like today and in the future, if you put "true", this will allow process (scan) all the records.

Thanks Edwin, That sounds like it will be perfect. Also while you thinking about how about adding delete sites to your API.

Thanks
Dave

Add and delete is performed by Multisites itself.
So use our Multisites front-end componnent to do that.
You can now change the layout from the front-end and create your own template.
