

## Restricted Access error

Posted by markredmond9 - 2010/08/14 16:08

---

I have the following directory tree structure:

```
public_html
-----masterwebsite
-----slavewebsite1
-----slavewebsite2
-----slavewebsite3
```

The masterwebsite contains JMS multisites. The slavewebsites use the symbolic link to the masterwebsite and have their own database (they do not share databases).

I have the following code inserted into the index.php of slavewebsite 2 and slavewebsite 3. The purpose of the code is to make the logo in the header a link to the home page of the website. It does this with a transparent image placed over the top of the logo in the header.

Perhaps this is due to a permission error.

Check also if you have a "error\_log" file that perhaps give you more information on the reason.
