Multi Login possible?

Posted by Striker8472 - 2010/12/28 23:53

Hi there,

I have bought the jms multisites component and tested it on a local copy with ubuntu and lampp (XAMPP 1.7.3a for linux). I need to have something like a multi login. I shared the joomla and jomsocial users from master to slave1 and slave2. I want to login on slave sites (slave1 and slave2) when I login in on master. I don't want to relogin on each website.

That is the current behaviour when I login on master:
http://www.teamninjagames.de/upload/img/pic_share/1.png
Logged in on master:
http://www.teamninjagames.de/upload/img/pic_share/2.png
Switch to slave1 (subdir):
http://www.teamninjagames.de/upload/img/pic_share/3.png
Switch to slave2 (subdir):
http://www.teamninjagames.de/upload/img/pic_share/4.png
As you can see on this screenshots I need to relogin on slave sites.
There exist a way to login on all sites even on the slave ones by using the "remember my details" flag. But this is not a useful solution because I won't that my users have to use this flag by default. This is one reason. The second one is that the users have to logout from each site.

http://www.teamninjagames.de/upload/img/pic_share/1a.png
Logged in on master:
http://www.teamninjagames.de/upload/img/pic_share/2a.png
Switch to slave1 (subdir):
http://www.teamninjagames.de/upload/img/pic_share/3a.png
Switch to slave2 (subdir):
http://www.teamninjagames.de/upload/img/pic_share/4a.png
The last 4 screens shows that I only login on all sites when using the "remember my details" flag but as I said I need to have another way to login on and logout from all sites simultaneous. Any advice?

==========

First the single sign-in consists in re-using the same session ID between website and use a facility present in the apache to return the same session ID of a same domain.

You can check if the session.cookie_domain is correctly assigned to the session.
Go in the Joomla / Help / PHP Information to see the parameter value.

You may have apache module that forbid to share the sessions between different subdomain.
This is the case of SIHUSHI apache module (or something like that)
