Logos Form and Report Manager

Posted by DeeEmm - 2011/05/10 04:48

Hi.

First off, would like to day that MultiSite appears to be the best package for serving multiple sites that I have seen so far. I've watched the video and read through the feature set and I'm pretty sure that it should work for my needs. But before I splash out and invest the money, I've got a couple of questions.

Here is an outline of what I am trying to set up.

The idea is provision of an online service that users subscribe to. After payment each user gets access to an online tool - for example an online journal and database. Each subscriber only has access to their own data, no data is shared between users.

So far, providing each user with their own 'website' seems to be the easiest solution. This is mostly as there are no multi-user components that can carry out the tasks that I need. I can easily create a custom website using Logos that achieves what I need to do. I can then replicate this site using MultiSite for each user.

My questions are as follows...

1.
Has anybody used MultiSite with Logos Form and Report Manager? Will it work? Logos is a tool that creates forms that can be used to interrogate and interact with the back-end database. I will likely use some custom tables specifically for Logos to interact with. Can these tables be included in the site replication? I can understand that you may need to actually test the application to determine this, but as this is also a commercial application, I am apprehensive in purchasing the full version until I can determine that it works. I can however supply a free version, although this does not have the same feature set. You can download the 'Community Edition' from the bottom of the following page http://ourdatasolution.com/solutions.html

2.
I notice that integration with virtua-mart is possible, does this mean that (slave) site creation can be carried out automatically with no interaction from myself? For example, A user visits my site, and purchases the online service. The slave site is created automatically after payment is processed. I assume that if this is possible, that there will be a shared database for the slave sites (1 or 2 database solution).

3.
If question 2 is possible, do the slave sites have to be on the same domain? I would like to have the site that sells the service on main-domain.com, but the actual service served from another-domain.com.

If 2/3 is not possible, do you know if it can be achieved by some other means?

Sorry for my many questions, and thanks in advance for your reply.

Regards.

/DM

Just thinking on this a little further, and think I need to clarify ...

Regarding question 3.

I guess what I am trying to achieve here is that the main domain is the sales / support site, but the slave domains are based on a different template. They do not necessarily need to be on different domains, but the content, modules, plugins etc will be different.

Example.

mysite.com hosts sales information about the service, it also hosts a support forum and the virtuamart component from which the service can be purchased.

When the service is purchased, the user gets access to the newly created subdomain (slave site) username.mysite.com.

username.mysite.com is not based on mysite.com.

Hope this makes sense.

Regards & TIA

1. Yes, LFRM manager works with MultiSites. It appears that it can be shared across different sites as well, but I haven't tried that feature and it seems a bit unnecessary as you can just connect to the database you wish with LFRM instead of sharing it with MultiSites.

2. I have no idea. Never used the payment system.

3. Yes, you can use subdomains with MultiSites. Although, I've run into using Joomla's SEF when using subdomains so I avoid it, but those problems may never crop up for you.

Thanks for the reply nicholas.

I've been busy setting up the site using LFRM and am ready to try and use multisite :)

I will let you know how I get on.

Regards.

hehehhee - managed to make a complete pigs ear of my site :D

Not so much cloned - more clobbered

Will restore the backup tomorrow and have another go

OK. Backup now restored.

At the moment I'm testing this on my local server, so the URL I am running from is http://localhost/sitename/

Any issues with running this from a subdirectory?
