Error after using TOOLS to install JCE on master

Posted by mulligan - 2012/01/23 21:03

I just installed/upgraded JCE editor on the JMS master and used TOOLS to populate and overwrite children. JCE works in the Master installation but the when I go to a slave site to edit an article I get the error message: "Call to undefined method stdClass::onDisplay() in /home/***/domains/***.com/subdomains/master/public_html/libraries/joomla/html/editor.php on line 268" (*** = my website). Does that mean the slaves can't find the JCE editor? How can I fix?

I suspect that a JCE plugin is missing in the slave site.
Perhaps there is new plugins to install in the slave site and that are not yet installed.

I suggest that you uninstall the JCE in the slave site and that you re-install it.

Uninstalled JCE on slave and on master. Reinstalled JCE on master and the slave FROM THE MASTER. Verified that the component and plugin are enabled on the slave. Same error message.

Fixed. Cleaned up the local installation on the slaves, reinstalled from the master and verified plugins. Still don't understand the hierarchy, but am learning.
