JMS, multisite for joomla - Joomla Multiple Sites and user sharing Generated: 8 September, 2025, 13:45

your master.

By default, the slave sites have their own menu, articles,, content and therefore it is not connected on

1/3

This is for a component submenu NOT a menu item or menulist

The submenu is found in helper.php so IS THE SAME for slave and master

```
eg
helper.php
public static function addSubmenuDefault($vName)
 JSubMenuHelper::addEntry(
 "Setup",
  'index.php?option=com_markets&view=saasmarkets',
 $vName == 'markets'
 JSubMenuHelper::addEntry(
 "Manage Profiles",
  'index.php?option=com markets&view=profiles&task=listProfiles',
 $vName == 'profiles'
 );
see administrator/components/weblinks/helper/weblinks.php for similar code
so what I want is:
public static function addSubmenuDefault($vName)
{
if(!$slave_site){
               JSubMenuHelper::addEntry(
  "Setup",
  'index.php?option=com_markets&view=saasmarkets',
 $vName == 'markets'
 );
}
else{
 JSubMenuHelper::addEntry(
 "Manage Profiles",
  'index.php?option=com markets&view=profiles&task=listProfiles',
 $vName == 'profiles'
 );
}
```

Re: A multisites aware component? Posted by edwin2win - 2012/05/21 12:54 The idea is good. We had the same kind of idea that we have included in JMS 1.3.x that we started almost 1 year ago. We are trying to speedup its release that include plenty other functionalities. We can just say, that this is effectively a good idea as we already prepared something similar.

Our solution will work in case when you share the whole website. Not when you have specific slave site

JMS, multisite for joomla - Joomla Multiple Sites and user sharing

because in this case, the menu are specific for each slave site.
