Multilanguage with Joomla 2.5 en Jms2Win 1.2

Posted by Alaink - 2012/08/29 17:20

Hi,
When a create a new slave, I have a new trouble (since I have publish de "classic" multilanguage module from Joomla 2.5)

When I write : http://www.travel-pro.be/Thuisindewereld/, the navigator change to : http://www.travel-pro.be/nl/Thuisindewereld/nl, and I'm receive a 404 code page error.

With a "classic" domain name, I have also (now) a problem : page 404
(exemple : http://www.reizenanny.be/)

For the old slave site, all still correct.

Any idea ?

Thanks,

Alain

The standard joomla language module automatically redirect the user to a subdirectory NL or other depending on the browser accepted language.
So if you are using a browser setup "nederlands" then you are redirected to "domains.com/nl".

The error 404 is perhaps due to the .htaccess files that is missing.
