Linux to windows

Posted by rehan - 2012/08/29 19:28

Hi,

we need to move a JMS multisite installation from linux to windows hosting (having Plesk Panel).

The linux setup has around 50 sites.

JMS multisite version is 1.2.x

The linux site is using symblic links.

Is this possible? If yes then please guide me to the correct direction. I have struggling with configuration since past few days and already converted all symbolic links to shortcuts.

Please help!!!

With JMS 1.2.x and Windows platform, the symbolic link is not available.
So you will not be able to use the symbolic link and you will have to consider that all the websites share the same directory than the master website.

With JMS 1.3.x, we have added the possibility to use symbolic link on windows platform in some specific case. PHP 5.3.3 or higher and Windows Server 2008 or higher, Windows 7, Windows Vista.

See JMS 1.3.x different variants
