Can't Duplicate Master on Multiple Domains/Account

Posted by pixelmaker - 2009/09/16 08:24

I've been trying for days to duplicate my master site to multiple domain names on the same shared server and can't get it to work.

I called my host and think I have correct permissions for a "super admin" user than can create new tables in an existing database on another domain account. My problem is that I can't figure out how to take the original MASTER, and duplicate it across 75 different domains that reside on the same shared server?? They all need to be duplicated into their own domain with seperate databases that end users can login to independantly. But also about 95% of the content will be shared and controlled from the "Master" site.

I bought all three of your products, multisites, multisites content, and multisites menuitem.
PLEASSSEEE HELP. I'm up against a deadline!! If it's possible I would love for you to give me a call. I am in Denver Colorado and my number is in an email I just sent to you from your contact form.

THANK YOU!! - Ken Elkins

First you just say that you don't arrive but you don't give me any usefull
information to guide you on which is really your teechnical problem.

Have you followed the tutorial step by steps.
Which are the answers to the questions in the tutorial ?

Which platform ? (Unix, Windows, ...)
Do you have symbolic link allowed ? Tutorial Video 4 to 7.
Are you able to create a fresh slave site ? Video 9, CP-03, CP-04.
Are you able to create a website from the front-end that replicate a website
? Video 13, Video 16, CP-05.
Which hosting provider (godaddy, cpanel interface, ...) ?

It is possible to use our our billable support if you want that we setup and configure your server.
You can order such billable support at
http://www.jms2win.com/download?page=shop.product_details&flypage=flypage.tpl&product_id=35&category_id=1
The final price will depends on the effective time spent to configure your
encironment.
If you order support, we also have MSN email for the chat only and also a
skype id.
We also using tool like www.teamviewer.com to share desktop and show you how we
proceed with the installation.

To duplicate a website, you have to define a JMS templates rule as explained in the video 13, 16, CP-05.
Once you have defined the replication rule, you can use it in the manage site.
