not able to create slave sites

Posted by rashmisharmamca - 2009/10/26 12:47

Hello,
I m, really tired of doing things, almost saw all videos but able to create slave site.
I followed all the instructions
when filling details in MANAGE SITES, i will click on the link to configure my site i will be getting following error:
"No configuration file found and no installation code available. Exiting..."

Please help me.:(

As you can find in this forum, this error message mean that either you have "no configuration" or "no installation" directory.

So depending on your slave site definition (probably deployed in a specific direcrory), you have to check that you have the "installation" directory available.
Perhaps you have deleted the directory.
You can use JMS check patches to be sure that the installation directory is present.

You have to check that you deployed directory contain the symbolic links and the installation directory.
You can also use the "hello world" procedure to try install an hello.php file into the installation directory to be sure that you can access it.

Perhaps you have also to check the permission on the installation directory to be sure that you can access it.

Whe joomla try to start, it check if the "configuration.php" files is present.
When this is not the case, it check if it can find the "installation" directory to ask you create a fresh joomla installation.
When both are not present it returns the message that you mentioned.

My deployed directory is {site_dir}. and it contains installation directory too but still i am not able to do so.

Please help me

_____

OK but what are the results of the other tests.
Does the hello world is working in the installation directory ?

Does your hosting server follow the symbolic link ?
Does the permission (owner, group) are identical ?

The procedure consists to use the hello.txt and hello.php to check that you can run them into the installation directory (because it seems it is not saw).

_____

now all is working. The error was due to permissions.

Now i want is that my newly created website should share the data of my previous website in which i had instaaled JMS, so plz tell how to do this.

_____

To share extensions, see the tutorial video 16
http://www.jms2win.com/tutorial#jms12x-16
Only a limited number of extension can be shared.
In the JMS product details, you have the link to the list of extensions.
Here it is also the direct link to the extension
http://www.jms2win.com/component/content/article/135

If you want to share the articles, see the extension "article sharing for JMS".

_____

i want to share the data that is coming from the database of previous website.
what to do?:dry:

_____

Which data ?
Each extension save their data in specific tables.

So just say "share the data" is not clear and to fuzzy.
You must give the enumeration of all the extensions data you want to share.
You have data for plenty extensions. So you have describe in detail which data you want to share and for which functionality.

If your question is just to replicate (clone) and NOT share the data, you can create a JMS templates to replicate the website.
