Flexiconten image upload error

Posted by lexxy2000 - 2009/12/28 03:39

---

how can i resolve this error i get when trying to use jms with flexi content.

Failed2:

phpThumb() v1.7.9-200805132119

"" does not exist

you can find flexi content at http://www.flexicontent.org

Can you describe how you get this error and the procedure you are using.
First I don't see any "uploads" directory in the com_flexicontent.

Do you have installed, created, configured .... something to define this "uploads" directory.

If you edit the code of the FlexiContent in phpThumbnail and you have a look on the different error, you see that it searches for PHP code that is not present (not delivered with the extension).

Did you get this error on the master website or on a slave site ?

If you have this error on the master website, this should be the same on a joomla website (without JMS) - so the error should be investigated with the author of this extension.

It seems that the "uploads" and "medias" directories are defined in the Flexi Content global configuration.

Perhaps you have to check and change the directory defined in this configuration or perhaps create the directories manually.

To answer a few of your questions?

1. No i did not get the error in the master site just the slaves.
2.I did not edit any of the flexi code.
3. Did not have to configure anything to determine upload path.

to replicate the error create a field that would allow you to upload an image under the field section then go to add items and try adding an item and upload the image. tell me what happens for.

Can you provide a detailled scenario to reproduce it. (If possible screenshot that show the steps to reproduce it).
Sorry I don't know this extension and tried to reproduce it without success.

First I would like to reproduce on a master website to understands why you have an error message that let suppose that the directory "uploads" does not exists and you say it is working.
Second, I would like to know how you have installed the FlexiContent into the slave site.
Did you re-installl this extension in the slave site or did you use the JMS tools that does not contain the FlexiContent definition yet.
FlexiContent requires plenty of plugins for the filelds. Are they installed in the slave sites ?
