Patches fail - Add	16 lines	containing	the routin
----------------------	----------	------------	------------

Posted by gdowling - 2010/02/21 12:36

Sorry to ask such a basic question, but I am very much a newbie here:

I have installed com_multisites_V1.2.22 and all is working well, until I decided to install the com_multisites_V1.2.22 onto another domain (sub domain iin this case).

I am guessing I am getting the error as it was already installed on a different domain.

Anyway it fails to install all the required patches (see below)

administrator/components/com_multisites/install.xml OK administrator/index.php OK administrator/includes/defines.php OK includes/defines.php OK includes/defines_multisites.php OK includes/multisites.php OK installation OK installation/includes/defines.php OK installation/installer/helper.php OK installation/installer/jajax.php OK xmlrpc/includes/defines.php OK configuration.php Not OK

•The routing wrapper is not present in this MASTER configuration file. Actions:

☐ Add 16 lines containing the routing wrapper to the slave site.

administrator/components/com_config/controllers/application.php OK administrator/components/com_installer/models/templates.php OK administrator/components/com_modules/models/module.php OK administrator/components/com_templates/admin.templates.html.php OK administrator/components/com_templates/controller.php OK libraries/joomla/application/application.php OK libraries/joomla/document/html/html.php OK libraries/joomla/filesystem/folder.php OK libraries/joomla/session/session.php OK components/com_content/helpers/route.php OK plugins/system/remember.php OK

I have tried the uninstall & reinstall route, but the same accurrs, please can someone advise...

Thanks Gary

1/2

JMS, multisite for joomla - Joomla Multiple Sites and user sharing

Generated: 13 December, 2025, 05:28

If you are trying the call JMS from a slave site, this is a kind of message that you can have as the slave site configuration file does not contain any wrapper.

JMS should not be installed and used in a slave site.

Theorically, only the master website needs to have the JMS installed.

If you have this error from the master website, then you can also go in the Global Configuration and re-save it. This also write the wrapper (only when you are the master).

JMS working now for all my slave sites, now how can I get templates (layout) working - see my other post
Thanks for your help
Gary
