deploy directory field for windows

Posted by goby22 - 2010/04/08 21:46

I see the post "Where is the deploy directory field?" i have a similar problam. I am developing websites for a school and the school has windows server 2003, apache, mysql and php for webserver. This is the plataform I need to work in.

my question is how can I access the deploy directory field or something.

ps. the webserver is local.

No way to access this fiedl on windows and explained in the tutorial video 3 to 7 and also in the user manual.

The "deploy folder" is only available for unix platform that have the "symbolic link" functionality available.

On Windows and IIS, the only way is to use the "Virtual Directories" to simulate it outside of JMS.
