JCE - Image Manager Extended 1.5.5 compatibility

Posted by rbaum - 2010/09/09 10:44

First of all, thanks for this great piece of software.

Unfortunately I just noticed some strange behaviour of the JCE - Image Manager Extended 1.5.5 plugin. Browsing the image folder it seems to me that this tool actually browses the image folder of my MASTER always, even though I am using it on a SLAVE.

For displaying the images it seems to use just relative links. Of course I do not have the same images on my SLAVE as on my MASTER so basically things are not working due to this behavior.

Please provide a fix for this issue. When you browse the image folder the JCE - Image Manager Extended 1.5.5 should display the correct image folder. This means that on the SLAVE it should browse the image folder of the SLAVE and on the MASTER it should browse the image folder of the MASTER.

I am ready for an upgrade B)
