Chmod front & back end

Posted by celso - 2010/09/23 09:38

Hi edwin,

At first at all, thank you very much for your help with others quiestions.

Well, I´ve got another question. When I create a slave site in back end, the configuration.php file is created with chmod 644 but when I create slave site in front end, it created the configuration.php file with chmod 444. I need that configuration.php with chmod 644 when i create a slave site in front end.

Thank you!!!!

I will try to reproduce what you describe but I don't see why you would have different chmod as this is the same code that is called to create the configuration.php file in both cases (back-end and front-end). So the result should be the same.

Are you creating "free" website or "billable websites" ?
Are you using the Bridge with VirtueMart to process billable website or do you have implemented a specific script that is run in the front-end. ?

Do you have the FTP Layer enabled or not ?

They are Free websites, without virtuematr bridge & I´m working without ftp layer.

Thank you very much
