protect acces to a slave site with password

Posted by crdacore - 2011/01/26 10:28

---

hello world,

I am looking for a way to block the access to a web site (a slave site created with JMS). I wish the access of one slave site being possible only with a username and password for example, or just password.

I did look in the documentation and search the forum but found nothing about it.

Do you know a way to do it ?

many thanks,

take care

By default, each website is totally independent and the users are specific to each slave site.
So ff you don't share the users between the websites, you have a full control in the back-end of each individual slave site.

If you decide to share the users, in this case, you can not restrict the access as you are sharing (not duplicating) the info and the access is automatically identical to all the websites.
The sharing of the users as well as the sharing of extensions consists in the sharing of the MySQL Table and therefore all the records (here all the users).
