jomsocial, kunena and jms:share only users/content

Posted by sinaptec - 2011/02/01 16:01

Hello i finally make it work: the social network using jomsocial and kunena on the master site, the slave site with shared this 2 components but with different menus and templates.

I have one big problem. Sharing jomsocial and kunena bring both content/user and also configuration sharing. This cause me the problem to cannot change jomsocial and kunena templates on slave sites.

I got a different template on the slave site so i need a different template for kunena and jomsocial. Is there a way to do not share configuration/layout or a trick to do it easily?

When you decide to share the JomSocial and Kunena, effectivelly, this also share the configuration that is saved in a specific table of these extensions.

Concerning Kunena, they use the table "#__kunena_config".
Perhaps you could try create a physical configuration table instead of a link on the shared slave site.

Concerning JomSocial, the table seems to be the "#__community_config"

Becaurefull if you are modifying the DB definition manually with PHPMyAdmin.

You have to drop the view and create a table based on the current reference defined in the view that you will drop.

This is possible with our billable support.
