

## some setup advice

Posted by shubert - 2011/03/30 01:42

---

I have a question about what are the optimal recommended settings for your product

I will be using jsm multisite for joomla1.6 with shared users and linked tables the sites mentioned below

Here is the situation

I am starting a new vps with the following

3 domains on the vps

60 gig space

4096 ram

2048 mhz processor

Using cpanel

Unlimited bandwidth

What do you recommend for php version? is there any modules that I should pay attention to outside of the standard Joomla recommendations

What do you recommend for MySQL version?

Should I consider anything in Apache version?

Are there any particular modules and/or settings that should be addressed?

I am asking this as it is my first vps and I am moving from shared hosting and want to make sure it is set up right for your components as they are a core part of my three sites.

Any help and advice would be appreciated

Thanks in advance

shubert

1) For Joomla 1.6, it is recommended to use PHP 5.3.x

2) If you want to share some extensions, it is recommended to use a MySQL version 5.x or imysql  
JMS Multi Sites is not yet compatible with other DB engines like oracle, mssql, ...

3) Check that you have the correct permissions for the files and folder (generally managed by suPHP)

Avoid using suhosin in Apache that may add restrictions for the sharing of sessions and other security checks when sharing the websites with subdomains

An Apache 2.x is good

Install the curl module that is frequently used.

JMS Multi Sites is flexible. The only think that it can not do is bypass the security that you may add in your server (i.e. suPHP not installed or suhosin installed).

This was very helpful thank you.

One more question is there any known issues with php 5.2.11 as this is need for mighty extention

No, there is no known issue.

JMS Multisites is compatible with PHP 4.3.3 or higher including now 5.3.x

See chapter 7 of the user manual.

## **Mighty & JMS**

Hi Shubert,

Sorry for bumping an old thread but didn't see a way to email you.

I see that you were setting up with Mighty Extensions. I am in the process of rolling out a network using JMS and Mighty and was wondering if you had any feedback on the two working together?

I see that Edwin has a set of patches for Mighty but since Mighty hasn't offered him unionCubed code it's not complete.

Did you buy the JMS Patch or forge your way on your own.. how did it work out? Pointers? Issues?

Thanks!

Edwin if you need to move this I understand!

CassVox

All I can tell you, is that we have customers with whom we works for when we built the patches for Mighty and that also had worked with Mighty team themself.

The solution had worked for this customer and we didn't received any other feedback that would report issue. So we assume this is working.
