

## Deployment directory for {site\_url}

Posted by allyro - 2011/04/15 13:56

---

Hi

First, I installed JMS on /home/usr/domains/xxx.com/subdomains/master/public\_html

I then set up a domain on /home/usr/domains/yyy.com/public\_html

When I set up a template to install a slave site on yyy.com, I use the deployment

/home/usr/domains/{site\_url}/public\_html

but I get the following error:master.xxx.com/public\_html] does not exists.

Why is {site\_url} using the master.xxx.com when deploying the site instead of yyy.com? Is my configuration wrong or should I be using a different keyword?

The deploy folder is wrong.

You can not use the {site\_url} that is a URL and not a directory name.

If you had use the {site\_id} to create the domain name (ie domain = {site\_id}.com), you could reused it into the deploy folder.

Read the yellow light that provide the description of each keywords.

The {site\_url} is the URL that you have currently in your browser.

So probably master.xxx.com that is your current website (the current master URL).
