Is this possible to do this with CB and JMS ?

Posted by titus - 2011/05/12 11:46

Hi,

I've a question about CB and JMS possibilities...
I'm developping a community website, and do several sites and blogs (templates) for each country where they can publish. To manage the community, i use community builder (CB 1.4). My question is, is it possible to redirect my communities website (templates) to the general (master) community.

In other word, today, i share in all my templates "user + CB".
All templates will show the CB-user profiles.
Is it possible to redirect "links on CB user" to master website ?
So they have only "one profile" and not one in each template...

If it is possible, how could i do this ?

I don't really understand your question.

If you shared CB between website then you see exactly the same content whatever the website. There is no replication - just sharing the CB content.

So I don't understand why you want to have a link to redirect on the master as soon as you share CB content. This is the same shared content.

To explain my idea : CB is for me, the tool to manage my community, so sharing is to manage users in first order. It would be great if my profile links, could redirect to the master profile.

One hand, in terms of SEO (one of my commmunity goal for users); and by the other hand because it will be more "fine" for users.
and not have :

SITE.com/community/userID
slave1.SITE.com/community/userID
slave2.SITE.com/community/userID
slave3.SITE.com/community/userID

...

Is it more clear ?

But I understand your reply and what it means, this is not imperative for me, but a question i have in my mind. Thanks for reply

No this is still not clear.
Where do you defined the "Profile Link" ?
Is this a configuration in CB ?
If yes, where ? Which screen ?

As I don't know where you setup the "Profile Link", I am not able to reply to your question as I don't know if the setup that you are doing can or can not be shared - and I don't know if you provide a full URL or a relative URL .

If you want to create website with
SITE.com/community/userID
or

slave2.SITE.com/community/userID

up to you to configure the JMS Slave site definition rule to accept such domain name.
