Share only user of a master website

Posted by Falco - 2011/08/08 13:42

How could i share only the user of a master website (not components or template) ?
in the example number 16 i see how to share the user of a slave website

could you help me ?

thanks

Emiliano

Yes you can share the users with the master event the fact that we do not recommend that.

If you want to share the users with the master, you just have to select in the "JMS Template" rule that you want to replicate the "template site" = instead of the slave1.

In general, we recommend to consider the master website as a repository or a library where you install the extension (without any data or users). See video 0.b slide 21-24.
But if you want to share the user with a master in which you put some content, this is possible.

So, if i have this configuration:

www.example.com
sub1.example.com
sub2.examle.com
sub3.example.com

and i wanto to share the user within all domain and subdomain, might i use the www.example.com as master ? on the slide 24 the domain www.jms2win.org seem not to share the user and extension with other subdomains

I have see many tutorials, have i to deploy this configuration ?

1 - install a fresh joomla on master.example.com on which install multysite component
2 - install the main site on www.example.com (same as slave_1 in your tutorials)
3 - install all the subdomain with the template function in multysite components (as slave1_a, slave1_b) that's share the user with mail site

is it correct ?

thanks

_____

1) If you have installed JMS on the www.example.com website to convert this www website into a master, you don't have to create a fresh slave.
You can use this master to share the users.
As I have already explained in previous reply, you have to change in the tutorial video 16 the fact that you share with the instead of the slave 1.

2) NO
If you want to share with the master, you don't need to create a fresh slave1.
Discard this part and go directly to the sharing definition.

3) Instead of creating a rule to share the slave1, you have to create a rule to share the master
In the "template site", replace the selection of "slave 1" by ""

_____

ok, now i have install the site as i like but i have a problemi with jomsocial:
i have installed jomsocial on every subdomain but on subdomain i can't create any goup subcategories (the popup windows remain loading), could you verify ?
thanks

_____

i have find this error with firebug:

JPath::check Snooping out of bounds @ /home/a2pcom/public_html/administrator/components/com_community/views

the path isn't on the slave istance, it's the path of the master.

could you verify ?

thanks

Emiliano
