Share new fields from master db table

Posted by axyswebs - 2011/09/16 14:00

I am having problems with my databases, I've added new columns to the vm_product table and I need them to replicated the extra columns across the rest of my shared sites that already have data stored in them.

How can I do this?

I know that if I create a new site it will hold the new columns but how do I update my existing tables to show the new columns?

When you change the layout of a table, you have to re-install the extension in each slave site to let it proceed with table modifications.

If you have changed the layout manually, you have to modify all the websites manually.

If the extension were shared, you just have to uninstall and reshare the extension. So that MySQL will get the new tables layout.
