Blank Screen connecting to slave

Posted by achartier - 2011/11/20 22:38

My master is located at http://192.168.1.68/ and I created a slave site called members which I am told I should map to http://192.168.1.68/multisites/members. When I enter this url I get a blank screen, no errors.

Any ideas?

Blank screen is the symptom of a PHP Fatal error.
If you are using apache, perhaps you have a error log file that provide more info on the reason of the bank screen.

Perhaps you simply have a permission error to access a file or a directory.

There are no errors being logged. What php script should be running when I hit this page? I can throw some debug into it to see if I can see what the problem is.

Thanks.

In general the entry point is "index.php".
If you don't find the "error log" file, contact the administrator of your server to ask him the reason. It should be written in a log file that perhaps you don't have.

There is no index.php file in the multisites/members directory, there are 3 files, index.html (which contains 1 line with a background color), cache, and config_multisites.php.

Also, I am running this in a private apache virtual machine under vmware so I do not need to go to a server admin to make changes.

_____

Where did you deployed the slave site ?

Check the value that you entered in the "deploy folder"
