Clean Slave in Windows 7

Posted by faustov - 2011/11/21 08:03

I am new in Joomla, but after some practiques, I have to create 3 different sites.
I found the problem to install 3 different installation folder, because of the size of each folder. I found this extension, I bought it like the solution for my problem, but I got other problems.
I tried to create diferent sites under multisites folder, one for each that I need to create (completly different between them).
I need to create a clean slave. After following some videos, I can't start with the procedure of installation joomla on each site.
I have installed the following:
Joomla Platform 11.2.0 Stable+Modified 27-Jul-2011 00:00 GMT
Joomla! 1.7.2 Stable 17-Oct-2011 14:00 GMT
Apache 5.3.8
php 5.5.16

I can't get the installation screen, even, when I create a template to copy the installation folder, I just get blank page.

I appreciate any help.

On Windows platform, the Symbolic Link is not allowed.
Based on you explain it seems that you want to deploy a slave site into a specific directory but the "deploy folder" field that is available when the Symbolic Link is allowed is not present.

You mentioned that you are using apache.
If you want to simulate the symbolic link and give different URL names, you can probably use the apache "alias" to create synonym of your master path.

If you are using JMS on a localhost, see also the procedure described in chapter 9 on how to simulate any slave site.
