COnfused and dazed!!

Posted by mrwild - 2012/02/20 07:11

Hi,

I have a master site and a slave.

I am using K2 on the master site. Everytime I update the K2 stylesheet on the slave it updates the master stylesheet even though there are 2 directories. I want to share k2 but for them to have different stylesheets. This goes for the modules as well.

I also am getting a blank white screen when i try to install a template or extention. this on 2 different multisite setups. It is very frustrating!!!.

Concerning the template, the description that you give me let suppose that K2 save the template in their /components/com_k2 directory somewhere.

As the /components directory is shared between all website, this is normal that you share the K2 templates.
So when you change something somewhere, as the files and folders are shared, this is automatically reflected in the other website.

Concerning the blank screen that you have when you try to install a template.
With which version of Joomla do you have this issue ?
If this is under joomla 2.5.x, retry with the JMS 1.2.77.
We fixed a problem related to the install with joomla 2.5 only.
See FAQ for the procedure to get the latest version
http://www.jms2win.com/en/faq/faq-joomla-multi-sites#cat-122

Confused and dazed!!

Posted by mrwild - 2012/02/21 03:19

Thanks for your reply.

I am finding that especially with k2.css, I would like them to be different between the 2 sites as the design of them is completely different. One is for a blog and one is for a web design portfolio. So I really wanted a way of there being 2 versions of this file. With the white screen, I am using the latest version 1.2.77 and its after i have upgraded the white screen has appeared.

_____

Heres the answer I wanted....

Adding k2.css to your normal template although i imagine you have to upload different images

_____

I followed the instructions however its not working . I imported them to both of the templates.

_____

If you have a white screen, this is the symptom of a PHP fatal error and you must have a error log file that give you the reason.
So have a look in your error log file to get more info on the reason of the white screen.

Can you write here the procedure that you used to customize the k2.css

Additional question, on which joomla do you try using K2 ?

In the other forum, they mentioned to put the k2.css in your joomla /templates/XXX/html directory to overwrite the current one used by K2.

_____

I will put the white screen erro message on later.

The k2.css in the directory of both templates and imported into the site with a line of code. The site is not reading it. I disabled the k2.css in the parameters. I also deleted the k2.css files from both sites components directory.

I am using joomla 2.5

The 2 sites are www.wildbate.com (main)
and www.bobseatery.com

They currently are not styled at all by k2.css

_____

I am now trying to create 2 k2 templates in the main site.
the second template for use in the slave site

Re:Confused and dazed!!

Posted by edwin2win - 2012/02/22 12:51

_____

When you watch the source html of the page of the 2 websites, you see that you have a problem in the second one.

wildbate use /templates/wildbbate/css/k2.css
where you can clearly read the name of the templates

In the bobseatery it uses
/templates//css/k2.css

and you can see that the template name is missing "//"

So you probably not selected the appropriate template name or you compute the value with something that return nothing.

_____

I finally did it.

It is actually quite simple....

I followed the last tutorial where I made copies of the default template and placed it in a K2 folder in the main template directory. This means I have 2 k2.css files and the templates assigned to different categories. So the blog looks different to the main portfolio.

All I need to do now is have multi category working and the posts will looks completely different throughout the different websites.
