# JRE Cache
Posted by hassanali20 - 2009/09/14 11:41

---

is multi sites component support JRE cache.

i installed the JRE cache in my master site, the configuration file of this component is stored in com_jrecache. when i enable cache master site data is displaying in the slave sites.

Send us this extension in attachement of an email to allow us reviewing it.
This extension is not yet defined in the JMS tools.
I remember you that the exhaustive list can always be checked at
http://www.jms2win.com/component/content/article/135

Hi,

I have installed the multisites component of version 1.1.12, where in we also found patch for jre_cache component.

It is working fine if we manually create jrecache.config.slavesitename.php in administrator/components/com_jrecache folder.
But jrecache.config.slavesitename.php is not creating automatically when we install com_jrecache for a slave site from "tools" or when creating the new slave site.

Can you please give fix for this.

The JMS tools does not create such specific confguration files.
The JMS tools just update the DBs content to declare (install or share) the extension.

If you want to have a specific configuration file for each JRE, you have to go in the back-end of the slave site and go in the JRE configuration.
The JMS patches consists to write the specific configuration.
By default when the specific configuration file is not present, JRE will read the the "master" one.
