

anyone tried the extension oziogallery?

Posted by attiburro - 2009/10/22 14:29

I tried to make it work on a couple of slave sites and it seems to work but the validator at <http://validator.w3.org> gives me a lot of errors.

The extension is quite useful and you can get it from here:

<http://ozigallery.joomla.it/>

The errors on my slave sites are here:

http://validator.w3.org/check?uri=http%3A%2F%2Fbarbyblos.com%2F&charset=%28detect+automaticall%29&doctype=Inline&group=1&user-agent=W3C_Validator%2F1.654

Any idea would be appreciated because I was already in a mess till now installing JMS but this time I suppose I need expert help.

Thank you in advance

Attilio Burroni

When you analyze your HTML code generated, you can see that you have an `iframe` inside the table and that your `iframe` mixes the syntax with parameters using `&` and `&`

Probably you should only use the `&` and not use `&` inside the table.

Ecco alcune delle nostre foto. In attesa del sito:
