

Kunena Forum JFolder::create: Could not create dir

Posted by jamiegee - 2011/07/12 19:11

Hi,

I have loaded a Kunena forum and when I load the forum page - <http://www.topmakeup.co.uk/forum> I get the error message onscreen - "JFolder::create: Could not create directory"

My open_basedir is set to 'no value'. How can I over come this?

Cheers
Jamie

From what I can gather the problem lies with specific folders not having permission because they are run from the master.

Is it possible to make the slave completely independent from the master once its been setup?

I think that you should first identify which is the directory path that can not be created. You could add a trace in Joomla to know the path.

When the path is known, this should help you verifying the hypothesis that you mentioned.

If you want to test your hypothesis concerning the creation of physical directory instead of a link, you can effectively create a JMS template rule that uses a "copy" action instead of a symbolic link.
