Error w Patches After Install YooTheme WARP Plugin

Posted by bonfiresalomon - 2012/06/05 22:20

Hello,

After installing and activating the Yootheme WARP plugin from JMS on the master site, the multisites component is reporting not all the patches are installed. Initially, the multisites reports two patches missing, one for widgetkit, one for ZOO. After attempting to install the patches, multisites reports multiple other patches as failed to install.

Ownership/permissions is confirmed not the issue.

Please advise on how to correct this error. Also, documentation for this plugin would have been helpful for reference.

Kind Regards,

Joomla 2.5.4

*Latest JMS, JMS WARP plugin, Widgetkit & ZOO.

Here are the initial patch errors:

administrator/components/com_widgetkit/helpers/path.php
Not OK

WARP5.5/6.0 does not contain the fix to work with the Joomla JPATH_ROOT directory

Actions:

Replace 1 line by 5 lines that fix the URL path computation when the template directory is a link.

administrator/components/com_zoo/framework/helpers/path.php
Not OK

Zoo does not contain the fix to work with the Joomla JPATH_ROOT directory

Actions:

Replace 1 line by 5 lines that fix the URL path computation when the template directory is a link.

Did you clicked on the "install" button in the top right to install the patches.

Can you also give the version number of widgetkit and zoo.

The latest test that I did was on zoo 2.5.19
and yoothemes patches 1.1.11
The patches were installed correctly.

Same. I have ZOO 2.5.19, widgetkit 1.0.5 June 4 edition, JMS 1.2.89 and the latest WARP plugin (today).

The 'code' below is what's initially reported by JMS as 'not OK' after I enable the WARP patch plugin. When I go to patches and click 'install', JMS reports multiple other patches as 'Not OK'. I've confirmed ownership+permissions are all correct.

Thoughts?

Here, I don't think this is a permission problem.

I suspect a problem in a source that would be modified.

For me, this is not zoo that cause the problem as I have re-installed the patches on this extension.

I will retry with WidgetKit to see if they have changed something in the warp.
I don't think so as they theorically using the same WARP library.

Is the patch plugin only supposed to be enabled on slave sites?

Also, I cannot change the slave site's style from the slave site. The slave site's template seems to be 'looking to' the master site's database for the slave site's style.

Is this not what the patch is supposed to fix?

How do I set template style parameters from the slave site's admin panel?

The patch plugin is only required in the master website and used to install additional patches in the "/templates" folder.
You don't have install the plugin in the slave site as it is not possible to install patches from a slave site.
JMS disable the "install" button when it is used from a slave site.

Re:Error w Patches After Install YooTheme WARP Plugin

Posted by bonfiresalomon - 2012/06/21 19:41

!) I've installed the plgMultisitesPatchesYoothemesWARP5_6_V1.1.11 patch/plugin. 2)I enable the plugin 3)JMS then prompts me to install patches ('Some patches are not installed....') 3) I click 'Install' 4) Site crashes 'Unable to connect to database' + many patch errors

This bug definitely revolves around ZOO. The patch algorithm does not F$*& everything up and installs smoothly when ZOO is not installed. ...unfortunately I need ZOO.

administrator/components/com_zoo/framework/helpers/path.php

Not OK
Zoo does not contain the fix to work with the Joomla JPATH_ROOT directory
Actions:
Replace 1 line by 5 lines that fix the URL path computation when the template directory is a link.

What is the issue with this patch/plugin? What do I need to modify ZOO manually?

(FYI, the plugin is only installed and enabled on the master site)

Send me the package of Zoo in the attachement of a email.
I will have a look if the code in the referenced source is modified and would explain that the patch can not be installed.

The latest review that I did for zoo is the version 2.5_19_j25
Also joint the "path.php" source in which you report that the patch can not be installed.

Re:Error w Patches After Install YooTheme WARP Plugin

Posted by bonfiresalomon - 2012/07/02 23:03

Hello,

update Using the following components:

Joomla 2.5.6
Widgetkit 1.1.1 (June 28th)
ZOO 2.5.20 (http://www.yootheme.com/zoo/downloads/)
JMS 2.92
Warp Patches 1.2.86

I've created a fresh Joomla installation. I then installed the above extensions in every combination possible to see if I could successfully patch ZOO (using a fresh Joomla installation every time). Every combination of patching/installing failed.

Based on this, I'm assuming there is some variable that is failing within the patch. Could there be a difference in code base between the free version and full version of ZOO that is creating the failure?

Anecdotally, I'm surprised you all haven't been able to recreate the same fail. Thoughts on this? Let me know if I can provide any additional information. I can provide the ZOO extension, but I'm assuming you'd rather just download it from YooTheme, no?

Thanks for looking into this.

Kind Regards,

==========

Sorry but I am not able to reproduce that.
The "path" file that you provided to me is correct and can be patched correctly in my environment.

I don't know what could be specific to fail on your environment.

The only solution that I see is that you debug the installation of the patch in your environment. If you want that we do it for you, this is possible with our billable support that you can order at http://www.jms2win.com/en/joomla-multisite?page=shop.product_details&flypage=flypage_multisites.tpl&product_id=35&category_id=1

It's not my position to pay for debugging a commercial product, especially a patch with no variables. I'd expect a commercial Joomla product to be robust enough to work 'out-of-the-box'. You'd have to convince me otherwise before I'd shell out more money.

Regardless, thanks for your contribution to this thread.

Anyone else, please let me know if you find a working alternative to the YooTheme patch.

Kind Regards,

==========
