Cannot login in one slave site afer upgrade

Posted by juan123de - 2012/08/27 14:05

Hello!

I have a strange problem: After upgrading to 1.2.94 I cannot login in one of my 4 slave sites anymore. The other 3 work perfectly!

I double checked config files in "/multisites", etc.

Joomla 1.5

Any help welcome!

best regards!

Juan

Verify the URL that you provide to connect on your slave site.
Sometime, you this is just due to a WWW that is missing in the definition.

When you go in the "Back-end" login form, verify the title of the website and ensure that you have the correct name.
In case where the slave site is not defined correctly, you receive the "master" website login.

If the login correspond to the correct website, verify if you are sharing the users between websites.
Use the JMS tool menu and the "table" tabs to verify the sharing between the websites.

If you share the users between website, verify that you try loggin with the first domain declared in the slave site definition.
