Slave Websites don't login on backend

Posted by darshan - 2012/09/11 12:29

Hello,

Recently I have transferred working setup of 1 master and 2 slave website to another server which is having following problem.(New Server Linux,supports Symbolic links)

I have configured two slave websites which show their individual home page but do not show other article pages ..

however,master website works fine.(both frontend and backend)

When I try to login on backend of slave website,it shows login page to enter username and password but does not authenticate administrator

Note : all configuration.php files are configured properly with db connection information

Hope you can help me to understand what's wrong ...

Thanks
