Article Manager Shows Blank Page for com_content

Posted by gonetwork - 2009/09/22 08:17

Installed a slave, all seems normal. Symbolic links to all components. Only copied media,images,templates,logs,tmp folders.

Went to access articles to unpublish. Click on Article Manager in the administrator panel and the site goes blank. Content is there, section,category and trash are normal. Article Manager works in Main site, just not in slave.

Any suggestions. Permissions are all 777.

Thanks

It is difficult to reply without an access on your system.
I have tried reproducing what you have described without success.

It would seem that when the problem has corrected itself. Curious on why it did that, but then again, I dont want to complain about good fortune. It now appears to be functioning normally.

Thank you for your attention to this.
