Wrong Links with Multi Sites Articles sharing

Posted by Zappu - 2010/04/19 18:14

The problem is with Multi Site Article Somponent!!!
So far everything is working fine with this component and I do not want to miss it, but today I have figured out a bad problem

When you load some articles of a different site, the read more link of the article does not link to the original article, it links to an article of the slave site which has the same id as the org. article wich is shown.

Do you have any solution for this problem? Couldn't the read more link be rewritten to link to the org. Site and Article?

Are you using a special plugin to process the readmore.

I have tried reproduce it with standard joomla and without success.
In my case, this is working perfectly.

I have tested with the latest "Article Sharing" version 1.0.10

You got me! Thanks for the hint. Of course, the read more on my site was delivered by JomComents. Turned it of there and everything is back to working.
